

# Uued meetodid karbapenemaaside produktsiooni avastamiseks

Anastasia Pavelkovich

Tallinn 2013

# Introduction

- Chromogenic media
  - Carba NP test I and II
  - MALDI-TOF MS based functional  $\beta$ -lactamase assay
  - RealTime PCR
  - Conventional PCR
- \* Production of any carbapenemase  
\* Production of Class .. carbapenemase

# chromID CARBA

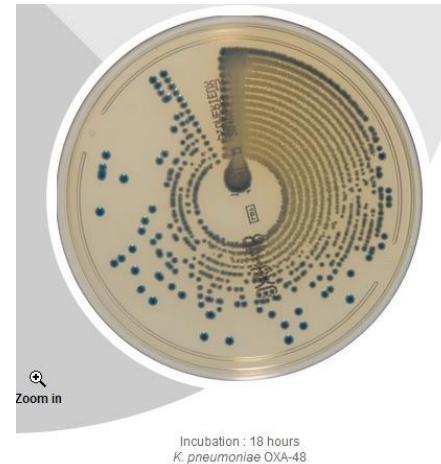

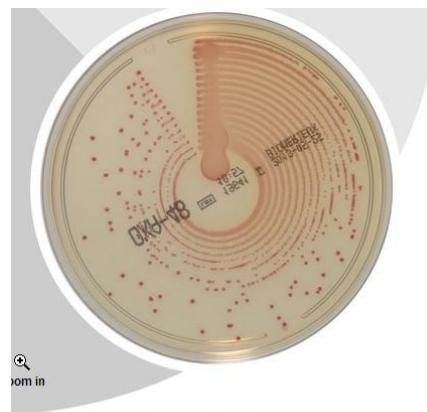

- Fast screening of carbapenemase-producing Enterobacteriaceae, especially **KPC, VIM and NDM-1** in **18-24 hours**
  - high sensitivity 97.4% [93.4-99.3]
  - high specificity 99.7% [98.9-100.0]
  - defined for use clinical specimens (stools or rectal swabs)
- chromID CARBA agar consists of a nutritive base combining different peptones. It contains:
  - A mixture of antibiotics which enable the selective growth of CPE
  - Three chromogenic substrates which enable the ID of the most frequently isolated CPE

# chromID CARBA related articles

- Conclusions: chromID CARBA medium demonstrated good performance with the collection of CPE used also for CPE difficult to detect due to the low carbapenems MIC, such as OXA-48 and VIM-type producing strains. This method showed a high correlation with the routine procedure and in 2 cases a higher sensibility in the detection of carriers.
- **Evaluation of chromID CARBA agar medium (bioMérieux) performance for the detection of carbapenemase-producing Enterobacteriaceae**
- A. Piazza, A. Galano, S. Bracco, S. Asticcioli, T. Giani, B. Pini, E. Nucleo, F. Arena, M. Caltagirone, F. Luzzaro
- Published 28. may 2013

# chromID OXA-48

- Active surveillance of CPE
- chromID OXA-48 agar consists of a nutritive base combining different peptones. It contains:
  - A mixture of antibiotics which enable the selective growth of OXA-48 CPE
  - Three chromogenic substrates which enable the ID of the most frequently isolated CPE

# chromID OXA-48 related article

- Comparative evaluation of the recently developed chromogenic culture medium chromID OXA-48 (bioMérieux) with chromID CARBA (bioMérieux) and SUPERCARBA showed that chromID OXA-48 and SUPERCARBA media have the highest sensitivity for detection of OXA-48 producing Enterobacteriaceae (91% and 93%) comparatively to chromID CARBA (21 %). The chromID OXA-48 has the highest specificity, with 100%, as compared to 53% and 68% for the SUPERCARBA and chromID CARBA media for detecting those OXA-48 producers.
- **Comparative evaluation of a novel chromogenic medium (chromID OXA-48) for detection of OXA-48 producing Enterobacteriaceae.**

- Published 30.sep 2013

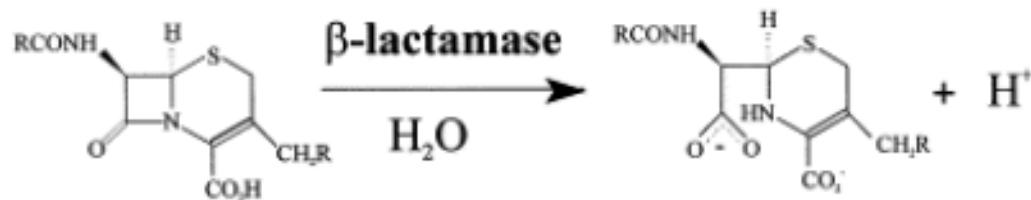

# Carba NP test

- Nordmann-Poirel biochemical test for rapid identification of Carbapenemase Types in Enterobacteriaceae and *Pseudomonas* spp.
- Carba NP test I - detection of carbapenamase presence
- Carba NP test II – detection of carbapenemase classes

# Carba NP test I

## The Carba NP (Normann-Poirel) test I

Hydrolysis of  $\beta$ -lactam bond releases protons decreasing pH and turning the color of phenol from red to orange/yellow

# Carba NP test I

## The Carba NP (Nordmann-Poirel) test I

### Material

- a. O/N culture of bacteria in MH, blood, or trypticase soya plates
- b. **Tube A:** Solution A: phenol red 0.5% w/v, zinc 0.1mM [(-) control]
- c. **Tube B:** Solution A plus imipenem 6mg/ml

### Method

1. Resuspend a 1/3 to 1/2 of a single calibrated loop of bacterial colonies in the four tubes
2. Incubate at 37°C for maximum 2h.
3. Optical reading of the color of each tube

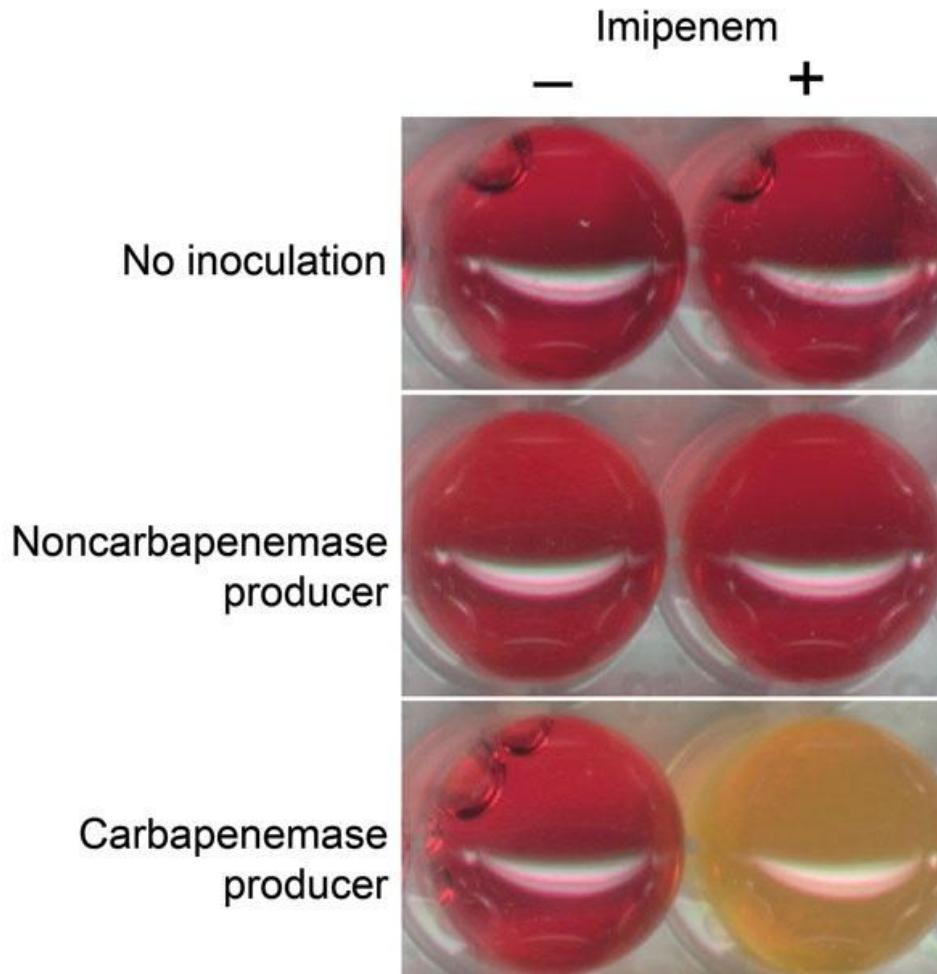

### Interpretation

	Tube A	Tube B
No carbapenemase	Red	Red
Carbapenemase Producer	Red	Orange/Yellow
Not interpretable	Yellow	Yellow

Usually, time required for obtaining positive results is as follows:

- KPC producers: 2 to 30 min
- OXA-48 like producers: 30 min to 1h
- Metallo-β-lactamases (NDM, VIM, IMP): 15 min to 1h

# Carba NP test I results

## CARBAPENEMASES

### KPC

Molecular Class A

- hydrolyze penicillins, 3<sup>rd</sup> generation cephalosporins, aztreonam and carbapenems
- plasmid accommodated
- partially inhibited by clavulanate, tazobactam & sulbactam
- inhibited by boronic acid and its derivatives
- not inhibited by chelating agents
- not inhibited by cloxacillin

### M $\beta$ Ls

Molecular Class B1

- hydrolyze penicillins, 3<sup>rd</sup> generation cephalosporins and carbapenems
- plasmid accommodated
- not inhibited by clavulanate, tazobactam & sulbactam
- not inhibited by boronic acid and its derivatives
- inhibited by chelating agents
- not inhibited by cloxacillin

### OXA-48

Molecular class D

- hydrolyze penicillins, older cephalosporins, carbapenems & temocillin
- plasmid accommodated
- not inhibited by clavulanate, tazobactam & sulbactam
- not inhibited by boronic acid and its derivatives
- not inhibited by chelating agents
- not inhibited by cloxacillin

# Carba NP test II

## The Carba NP (Nordmann-Poirel) test II

### Material

- a. O/N culture of bacteria in MH, blood, or trypticase soya plates
- b. **Tube A:** Solution A: phenol red 0.5% w/v, zinc 0.1mM **[(-) control]**
- c. **Tube B:** Solution A plus imipenem 6mg/ml **[(+ control)]**
- d. **Tube C:** Solution A plus imipenem 6mg/ml and tazobactam 40mg/ml **[KPC inhibition]**
- e. **Tube D:** Solution A without zinc plus imipenem 6mg/ml and EDTA 0.03M **[M $\beta$ L inhibition]**

### Method

1. Resuspend a 1/3 to 1/2 of a single calibrated loop of bacterial colonies in the four tubes
2. Incubate at 37°C for maximum 2h.
3. Optical reading of the color of each tube

# Carba NP test II

## The Carba NP (Nordmann-Poirel) test II

### Interpretation

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+ tazobactam (tube C)	Imipenem+EDTA (tube D)
No carbapenemase	Red	Red	Red	Red
Ambler class A carbapenemase	Red	Orange/Yellow	Red	Orange/Yellow
Ambler class B carbapenemase	Red	Orange/Yellow	Orange/Yellow	Red
Ambler class D carbapenemase	Red	Orange/Yellow	Orange/Yellow	Orange/Yellow
No interpretable	Yellow	Yellow	Yellow	Yellow

Usually, time required for obtaining positive results is as follows:

- KPC producers: 2 to 30 min
- OXA-48 like producers: 30 min to 1h
- Metallo-β-lactamases (NDM, VIM, IMP): 15 min to 1h

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+ tazobactam (tube C)	Imipenem+EDTA (tube D)
No carbapenemase	Red	Red	Red	Red

Internal control  
(Lysis Buffer+inoculum)  
+  
Solution A without IMP

**negative**

Lysis Buffer+inoculum  
+  
Solution A with IMP

**negative**

Lysis Buffer+inoculum  
+  
TZB  
+  
Solution A with IMP

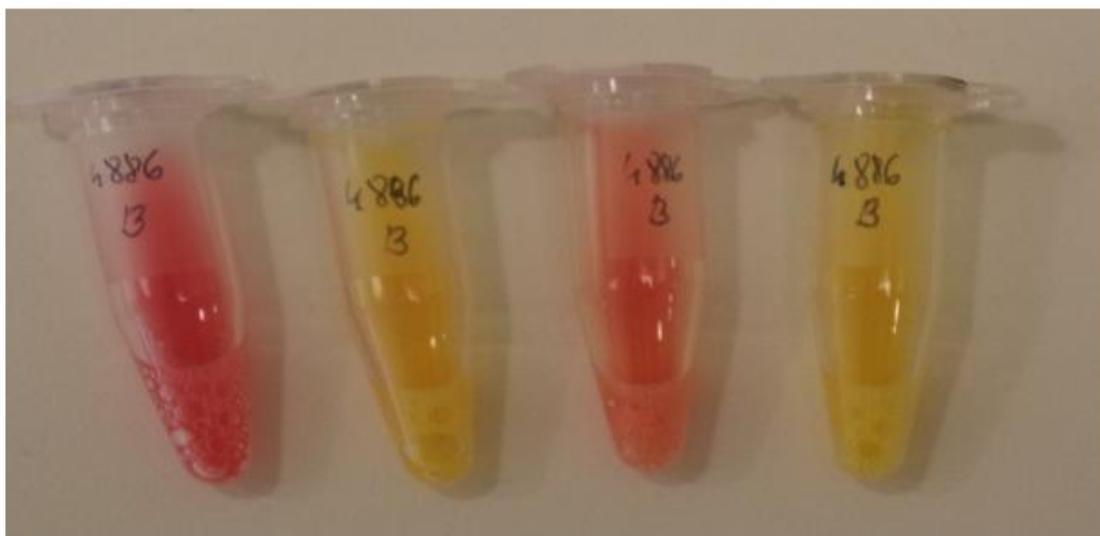

**negative**

Lysis Buffer+inoculum  
+  
EDTA  
+  
Solution A with IMP

**negative**

**Interpretation → negative for carbapenemase**

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+tazobactam (tube C)	Imipenem+EDTA (tube D)
Ambler class A carbapenemase	Red	Orange/Yellow	Red	Orange/Yellow

Internal control (Lysis Buffer+inoculum) + Solution A without IMP	Lysis Buffer+inoculum + Solution A with IMP	Lysis Buffer+inoculum + TZB + Solution A with IMP	Lysis Buffer+inoculum + EDTA + Solution A with IMP
<b>negative</b>	<b>positive</b>	<b>negative</b>	<b>positive</b>

Interpretation → class A carbapenemase (e.g. KPC)

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+tazobactam (tube C)	Imipenem+EDTA (tube D)
Ambler class B carbapenemase	Red	Orange/Yellow	Orange/Yellow	Red

Internal control (Lysis Buffer+inoculum) + Solution A without IMP	Lysis Buffer+inoculum + Solution A with IMP	Lysis Buffer+inoculum + T2B + Solution A with IMP	Lysis Buffer+inoculum + EDTA + Solution A with IMP
<b>negative</b>	<b>positive</b>	<b>positive</b>	<b>negative</b>

**Interpretation → class B carbapenemase (metallo-beta-lactamase VIM, NDM)**

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+ tazobactam (tube C)	Imipenem+EDTA (tube D)
Ambler class D carbapenemase	Red	Orange/Yellow	Orange/Yellow	Orange/Yellow

Internal control (Lysis Buffer+inoculum)	Lysis Buffer+inoculum	Lysis Buffer+inoculum	Lysis Buffer+inoculum
+ Solution A without IMP	+ Solution A with IMP	+ TZB + Solution A with IMP	+ EDTA + Solution A with IMP
<b>negative</b>	<b>positive</b>	<b>positive</b>	<b>positive</b>

Interpretation → class D carbapenemase (e.g.OXA-48)

	No antibiotic (tube A)	Imipenem (tube B)	Imipenem+ tazobactam (tube C)	Imipenem+EDTA (tube D)
Ambler class A carbapenemase	Red	Orange/Yellow	Red	Orange/Yellow
Ambler class B carbapenemase	Red	Orange/Yellow	Orange/Yellow	Red

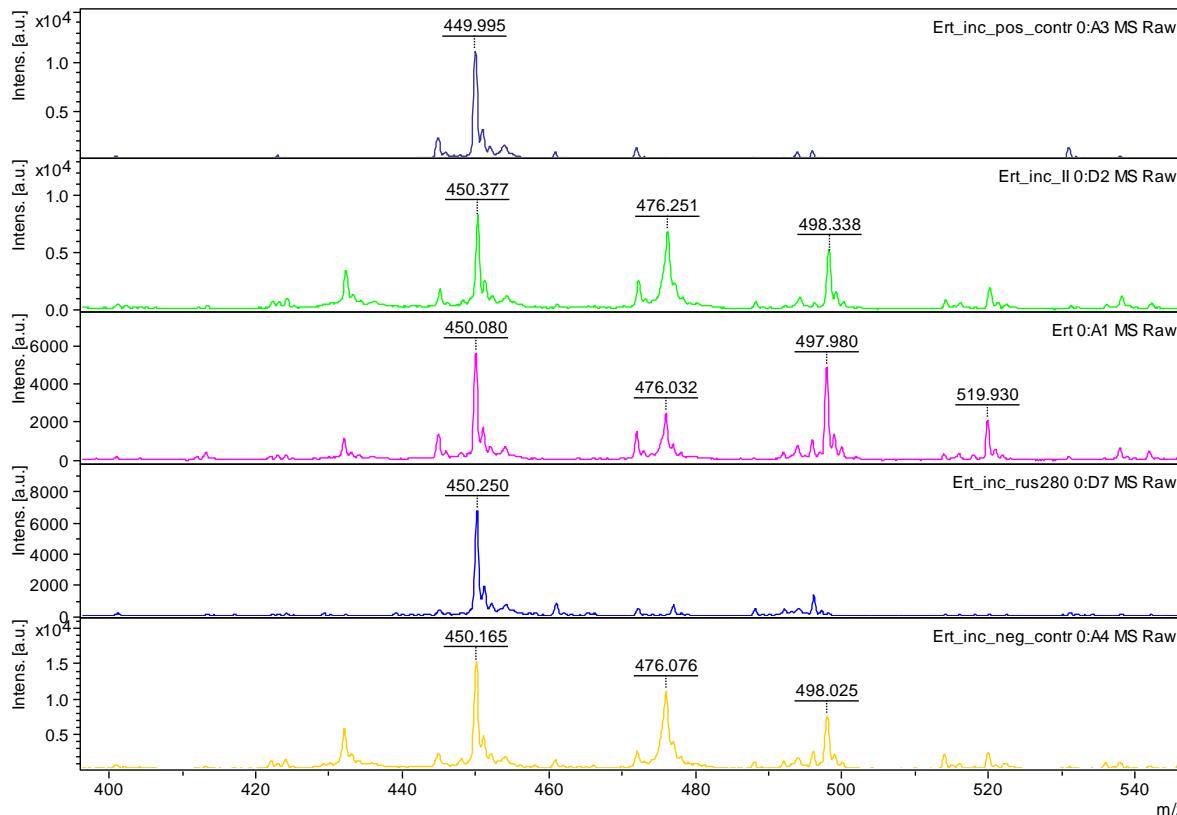

Internal control (Lysis Buffer+inoculum) + Solution A without IMP	Lysis Buffer+inoculum + Solution A with IMP	Lysis Buffer+inoculum + TZB + Solution A with IMP	Lysis Buffer+inoculum + EDTA + Solution A with IMP
<b>negative</b>	<b>positive</b>	<b>positive</b>	<b>positive</b>

**Interpretation → class B carbapenemase (e.g. VIM) + class A (e.g. KPC)**

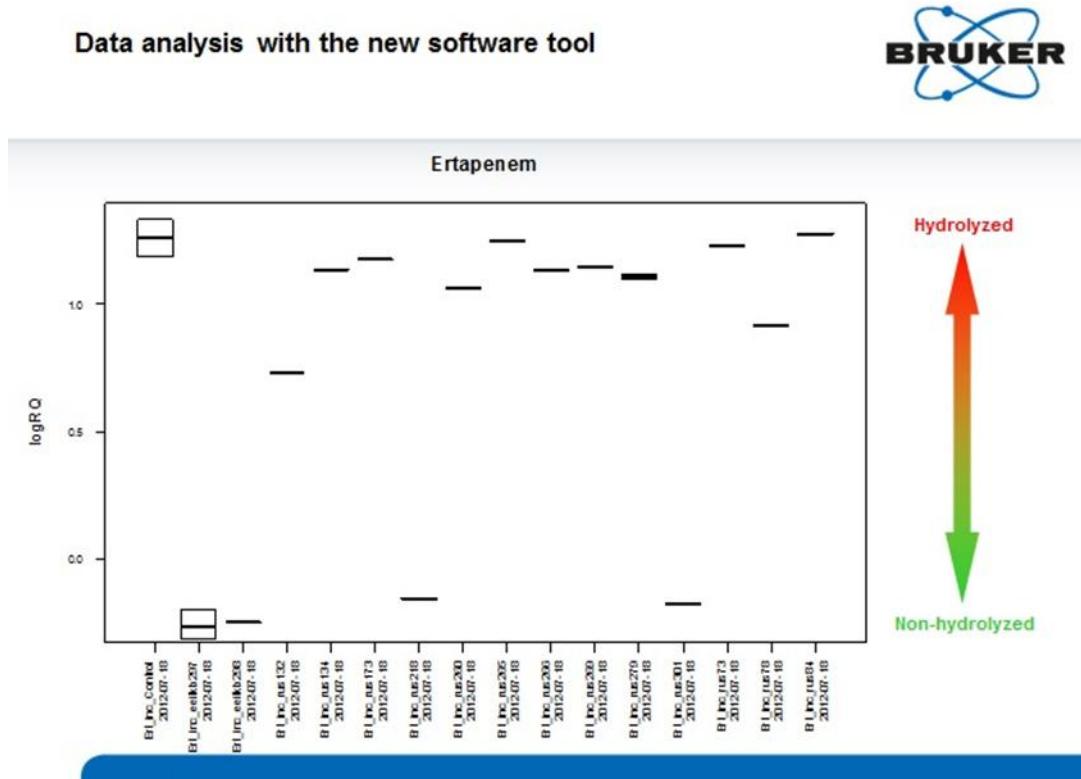

# MALDI-TOF MS based functional $\beta$ -lactamase assay

- First protocols published in 2011
- The main point: detection of antibiotic degradation products using MALDI-TOF spectrometer

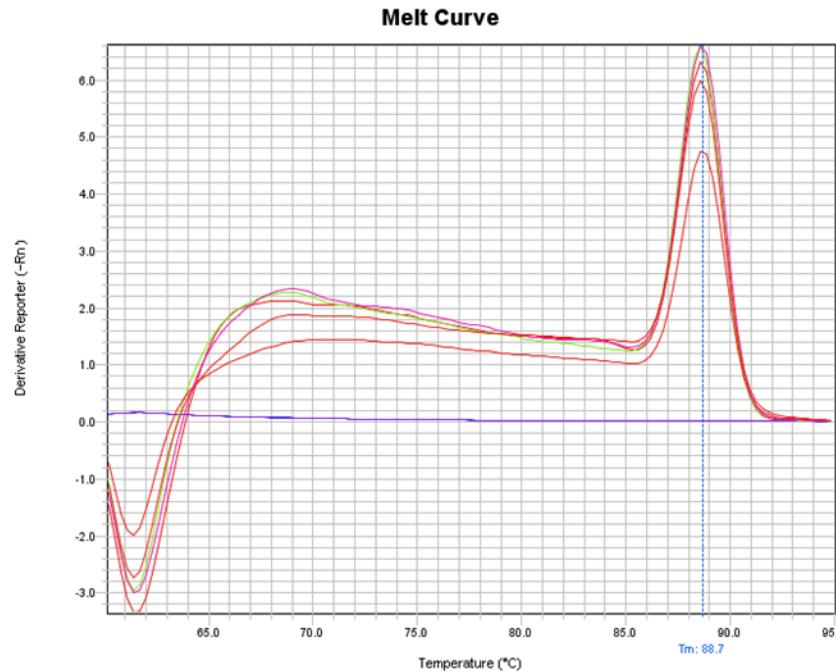

# Automated evaluation – new software tool by Bruker

- Software is still not commercially available
- Demonstrates degradation stage of antibiotic

# Multiplex RealTime PCR

- Used in BEEp project
- $bla_{IMP}$ ,  $bla_{VIM}$ ,  $bla_{GIM}$ ,  $bla_{OXA-48}$ ,  $bla_{NDM}$  and  $bla_{KPC}$  genes' detection

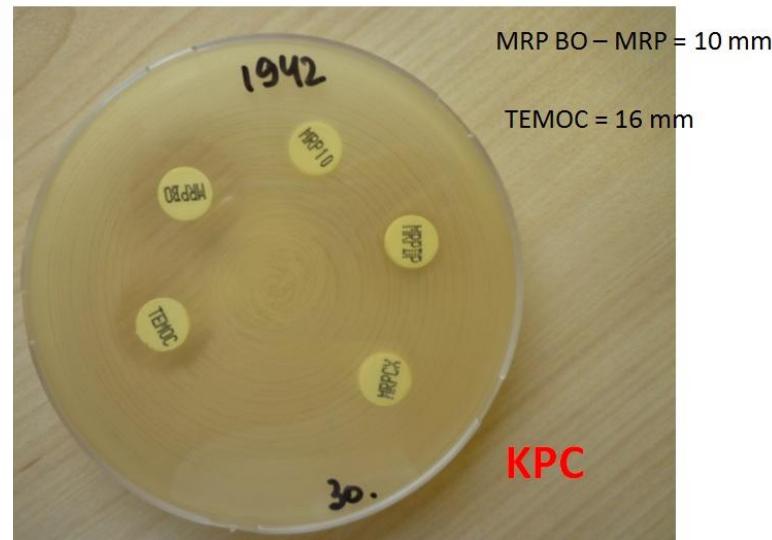

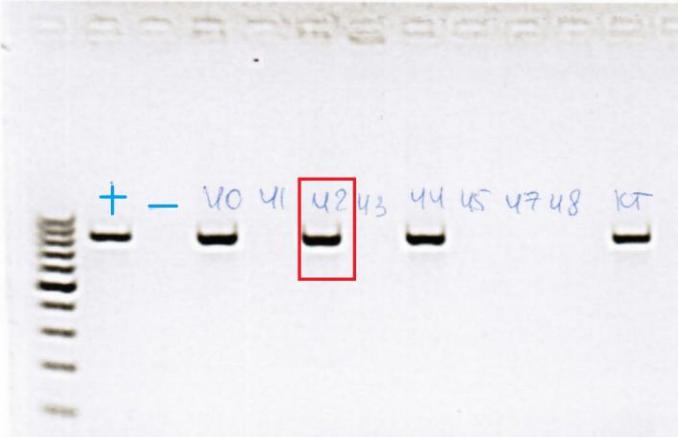

# PCR

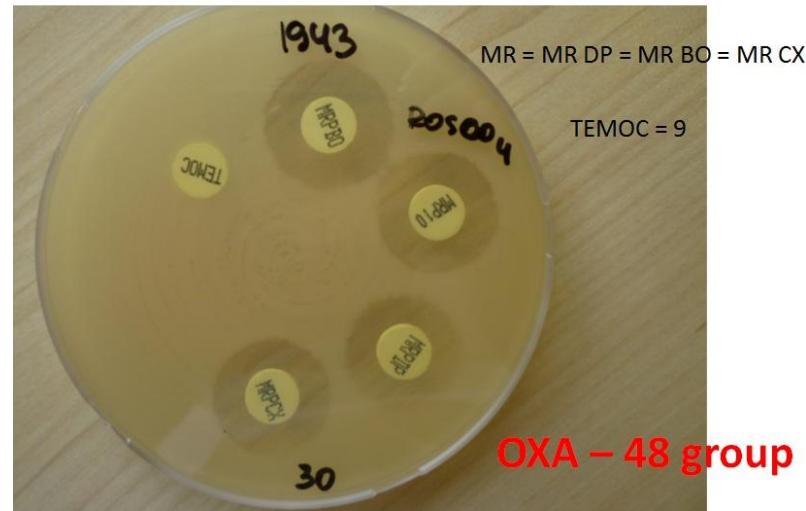

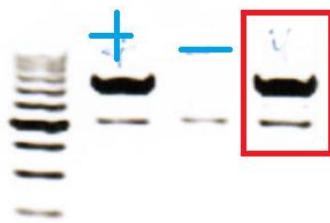

- Used in EuSCAPE EQA
- 100% correlation in EQA answers
- Protocol for  $bla_{VIM}$ ,  $bla_{OXA-48}$ ,  $bla_{NDM}$  and  $bla_{KPC}$  genes' detection
- Simple in reproduction in routine lab

# 1942 strain – KPC positive KP
